

What Your Saw Needs

Rapid Saw Gauge

Simply apply it as you apply your present swivel gauge. No fitting necessary. The Rapid Gauge is quick and accurate. Will take in measures from 6 points to 133 ems instantly. No need hunting for an extension gauge. Has "micrometer" adjustment to fractions of points. Can easily be applied to any saw besides the Miller and it is by far the best gauge ever conceived for any composing room saw.

Sure-Grip Work Holder

Apply the same as your present holder. No fitting necessary. This is the only workholder for the Miller saw ever invented that will hold the work securely without "fanning" towards the trimmers and will hold firmly two-thirds more linotype slugs at one cutting than any other holder on the market. There are no ratchets or teeth to wear and give trouble.

New Mitring Attachment

A mitring attachment which can be applied in a few seconds and removed just as rapidly. It has a range in thickness from 2 points to 36 points and in lengths from 3 to 65 picas. The notched end of block is for 6, 12 and 18 point thicknesses and smooth end for miscellaneous thicknesses.

New Spindle and Bushings

These spindles are made as accurate as can be made and will fit your saw perfectly. The finest bronze is used in the bushings. Oil rings and fastening screws are included with the above.

Improved Hood

A new design of aluminum hood which is considerably strengthened at the hinge end and is adjustable to height. Has a convenient finger grip for raising, eliminating the danger of getting fingers into the saw.
